EYP1016 - Introducción a la Estadística

Ayudantía 7

Profesora : Anita Araneda
Ayudante : Pilar Tello
Fecha : 26 de Abril del 2016

1. El tiempo en minutos que demoran los alumnos de la universidad en correr un cross (1 km.) puede ser modelados a través de una distribución normal de media 4.5 (minutos) y varianza 2.25 (minutos cuadrados).
 - a) Calcule la probabilidad de que un alumno cualquiera se demore menos de 4 minutos.
 - b) Calcule la probabilidad de que un alumno cualquiera se demore entre 3.5 y 5 minutos.
 - c) Determine el tiempo t_0 tal que el 10 % más veloz de los alumnos demore menos que este.
 - d) Si un curso tiene 20 alumnos, ¿cuál es la probabilidad de que exactamente 3 de ellos se demoren entre 3.5 y 4.5 minutos?

Tabla Normal Estándar
